## FREQUENTLY ASKED QUESTIONS

# GRANT ASHLEY

Specialist in micropigmentation  
and trainer

### *What is micropigmentation?*

It is a semi-permanent makeup technique that involves inserting pigment superficially into the skin to enhance our features naturally.

Micropigmentation can be done to repopulate and improve the shape of the eyebrows, to give depth to the look with eyeliner, to give volume and color to the lips or even to reconstruct the nipples.

The result is completely personalized and is decided between the patient and the professional.

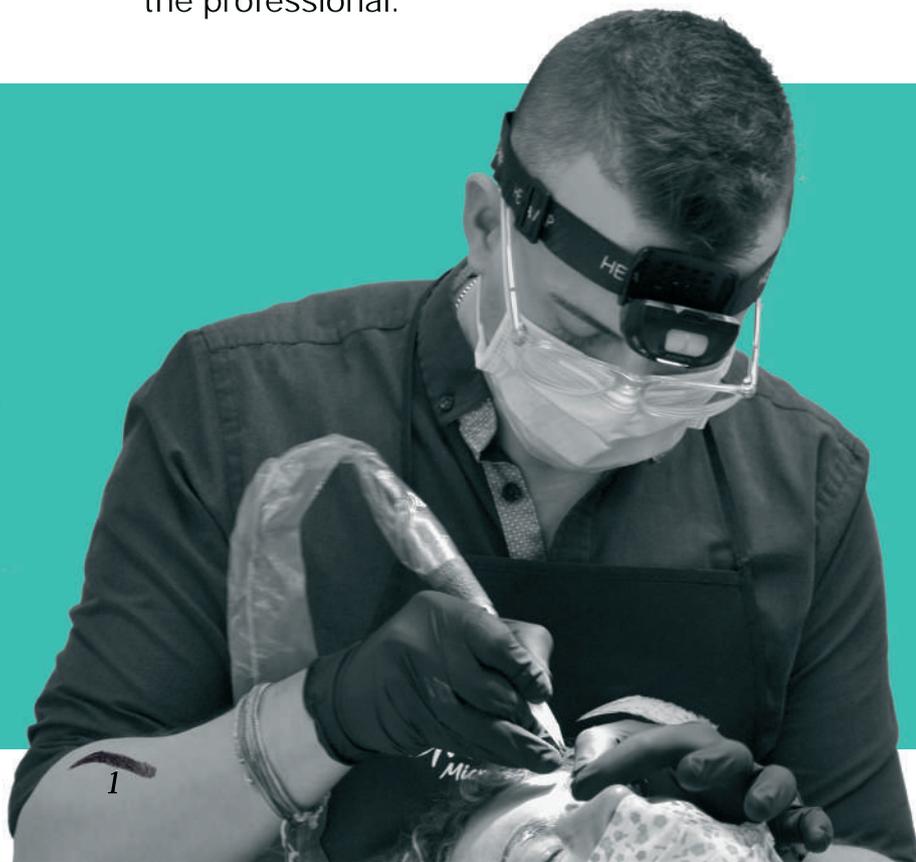

@grantmicropigmentation

## DO YOU WANT TO LOOK BETTER?

### *Should micropigmentation be retouched?*

To touch up a treated area, it is necessary to leave the recommended time for the correct healing of the skin. This time can be between 35 and 40 days. Once this recovery time has gone through, you can decide if needed to retouch, depending on how the treatment has evolved over time.

# FAQ'S

## TOP 5

### 1 Is micropigmentation painful?

No, the degree of discomfort of micropigmentation depends on each person and also the area to be treated. In the eyebrow area the sensation of pain is imperceptible. However, the area of application of the eyeliner or the lips are more sensitive areas and a slight discomfort can be noticed during the process.

### 2 How do fresh eyebrows look?

The result is always completely natural from the first moment. Immediately after treatment, the pigment may look slightly more intense, but there is no inflammation.

### 3 Is it true that micropigmented eyebrows turn blue or red?

No, because we use mineral pigments that do not change color over time.

### 4 Are eyebrow hairs removed?

No. In order for the final result to be as natural as possible, only the hairs needed to achieve the shape desired by the patient are removed.

### 5 Is there a difference between micropigmentation and microblading?

Yes, there are differences. With the microblading technique, a series of superficial incisions are made using a scalpel, which is then impregnated with the pigment. In the case of micropigmentation, the treatment is performed using a dermograph and a small needle,

which allow a more natural result accurate, durable, natural and painless.

## GETTING TO KNOW

# JESSICA SOUTO

- **To get started, tell us who Jessica Souto is ...**

I was born in Mallorca, I have lived part of my life in Lleida, but now I have lived in Manacor for two years. I love martial arts, in fact, I've been practicing Taekwondo for 13 years. Also music, reading, walking in nature and discovering new places.

- **How did you get started in this world?**

I've always had a passion for aesthetics, about 8 years ago I started my career working in this field in different fields and for a few years now, in semi-permanent make-up with Grant Ashley.

- **Which areas of the body can be micropigmented and for what purpose?**

Micropigmentation is used to reconstruct, improve the shape and increase the density of the eyebrows, the lip color, as well as the lower and upper eyeliner.

- **What is your specialty?**

As for the number of treatments, my specialty is eyebrows, although many of my clients are very surprised and satisfied with the micropigmentation of their lips.

- **What do you think are the keys to optimal treatment and outcome?**

First of all, to listen and capture the taste which each client wants, it must be done having in mind that each treatment is unique and totally personalized.

## OUR SPECIALIST

# PACO GARCIAS

### Scalp micropigmentation

Paco Garcias is a specialist in hair micropigmentation, this technique consists of a natural simulation of the birth of hair on the scalp.

Currently, hair micropigmentation is very unknown, but highly effective because the results are immediate, safe, without any complications and with a full guarantee.

@micro.capilar.mallorca

Hair loss is a delicate moment in the life of some people, as hair plays a key role in aesthetics and personal image.

Hair micropigmentation is a current solution for both male and female hair loss; a treatment by which natural pigments are applied at the epidermal level to simulate the natural appearance of the actual hair follicles, adapting the treatment to the hair loss and the desired appearance.

# SCALP MICROPIGMENTATION

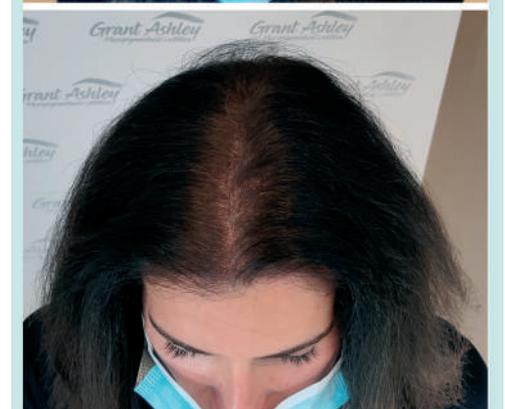

## YOU CAN GET IT

- ▶ Shaved effects:  
It creates an almost imperceptible shaved hair effect, simulating hair growth, perfect for short hair.
- ▶ Density effect:  
For both men and women, in patients with longer hair, it reduces transparency and prevents lightening of the hair.
- ▶ Camouflage of scars:  
Camouflages and hides scars from surgery on the head area or other surgeries.

## BENEFITS

- ▶ It is a minimally invasive solution that allows you to live a normal life from the moment of its application.
- ▶ Provides immediate improvement, with a fully visible natural result.
- ▶ It is semi-permanent, over time the pigment disappears, as the tone and intensity decrease until the points disappear.
- ▶ Mineral pigment is used that leaves no residue on the skin.
